VI- READING COMPREHENSION (110 Marks)

- Read the following passage carefully, then answer the questions below:

One of the biggest and most expensive transportation projects in the world is bridge building. Bridges are important links that carry cars, trucks and trains across bodies of water, mountains or other roads. As a result, **they** have to be strong so that they won't fall or collapse.

Bridge collapses can be tragic events, leading to loss of life and serious property damage. That's why bridge engineers, designers and builders must always take their jobs very seriously. The best way for them to prevent these accidents is to understand why bridges collapse in the first place. Understanding bridge collapses can lead to major changes in the design, construction and safety of future building projects.

There are many reasons why bridges fall which can be either due to their design or to external factors. Historically, more bridges were made of wood and were much more sensitive to fire. This was particularly true of old train bridges that would sometimes catch fire and burn to the ground. Besides, a large number of bridge accidents occur during the construction of the bridge itself. These accidents are often due to an error made by the engineers, such as a miscalculation. The bridge collapses under its own weight, and this can be deadly for the workers on it at the time. Additionally, earthquakes damage all structures, including bridges. Luckily, this kind of collapse is relatively **infrequent**, especially with modern bridges. Engineers have learned to design bridges in earthquake zones on areas that are much more resistant to movement. Moreover, some bridge collapses are mysteries, and engineers only realise the reasons after they do a complete research. In some cases, this could happen because low-quality material was used in the construction, or because of a problem in an important part of the bridge. In other cases, the bridge was designed only to support a certain amount of weight and no more.

As for external factors bridge collapses can be due to boat or train crashes. Both of these kinds of accidents are extremely rare, but boats and trains can cause a bridge to collapse for different reasons. With trains, it's the high speed that can bring a bridge down. With boats, it's the heavy weight that can cause the collapse, even if they are moving very slowly when the crash happens.

The best way to avoid bridge failures is to plan for them. Modern technologies that can detect structural weakness, safer working environments and better designs can all help to reduce these terrible accidents.

- a) stop using boats and trains.

- a) Earthquakes always damage bridges only.
